

Splunk Journey – Day 03

Date: 2026-06-14

Objective: Master Splunk field management, extraction, and utilization for enhanced data analysis.

Using the Fields Sidebar

The fields sidebar is a powerful tool for exploring data. It categorizes fields into:

- **Selected Fields:** Default fields like host, source, and sourcetype.
- **Interesting Fields:** Fields automatically discovered by Splunk in your events.

[illegible]

Adding More Fields

Customize your results view by promoting fields:

- Locate the field in the "Interesting Fields" list.
- Click the field name and select "Yes" to add it to "Selected Fields."

The screenshot shows the 'Select Fields' dialog box in Splunk. The dialog lists various fields with checkboxes for selection. The 'host' field is selected. The dialog also shows the number of values and event coverage for each field.

Field	# of Values	Event Coverage	Type
host	7	100%	String
source	6	100%	String
sourcetype	1	100%	String
da	>100	27.63%	String
date_hour	7	100%	Number
date_mday	1	100%	Number
date_minute	60	100%	Number
date_month	1	100%	String
date_second	60	100%	Number
date_wday	1	100%	String
date_year	1	100%	Number
date_zone	1	100%	String
dh	>100	27.63%	String
dp	22	27.63%	Number
ds	3	27.63%	String
fes	>100	27.63%	Number
fet	>100	27.63%	String
fss	>100	27.63%	Number
fst	>100	27.63%	String

Extracting Fields

When Splunk doesn't automatically identify data points, use the Field Extractor (IFX):

- Define custom fields based on patterns in log data.
- Essential for searching, filtering, and reporting on elements not natively parsed.

Utilizing Selected Fields

Selected or extracted fields serve as powerful primitives for analysis:

- Perform complex queries.
- Build statistics tables and visualizations.
- Structure unstructured logs for threat hunting.
